High-fat diet and acute stress have different effects on object preference tests in rats during adolescence and adulthood

Behavioural Brain Research, Volume 399

February 5, 2021

Written by **Karina Glushchak**

Highlights:

- High-fat diet reduces novel location preference across all ages.
- Acute stress reduces novel object, but not location, preference across all ages.
- Adolescents fed high-fat diet continue to have decreases in novel location preferences even after switching to control diet.
